

Extended Data Figure 4 | Additional representations and analyses of Lin⁺ tags. **a**, Lin⁺ clones of the second and third mice used for quantifications in Fig. 1d–g. **b**, Scale-adjusted binary (presence/absence) representation of all detected MkP and erythroblast tags in the

experiments from Fig. 1d–g. **c**, Relative quantification of scale-normalized clone sizes for each lineage, comparing unilineage versus oligo/multilineage clones. Values are interquartile range and median from three independent mice at four weeks and eight weeks after induction.
